## Thread: Anyone tried Liquid Trust

*evensteven69 - February 12, 2011, 4:30 pm*

Been thinking of giving Liquid Trust a try. I have read up on Oxytocin, and am curious about it and it's effects. I currently use Chikara, and am wondering if the results would be the same. Chikara is a great social lub but thats about it. Where as the Oxytocin is a chemical that is released in the body when organisming. So am wondering if I will get social experience plus more. Any advice?

*mark-in-dallas - February 12, 2011, 4:45 pm*

I've made 2 purtchses of Liquid Trust, the first seemed to give me a bit of an advantage, the second nada, zip!

Personally, I wouldn't buy it again.

Oxytocin is also what creates the intitial bond between mother and child.

*Pagodeiro - February 12, 2011, 6:20 pm*

Some swear by it ...others don't ...

Terry thinks it's great and in the right context ( business situations ) it will be useful !

works great on old women ( grandma of my ex ) to calm them down and make them talk !

I had really good experiences with one of my former employees ... i nearly tried everything on this bloke and only Liquid Trust or Pheromones ( Product by DST ) worked on him !

Made this guy really polite and it was obvious that he felt weird beeing that nice

I personally think that Liquid Trust works better on people that have children ... don't know why but that's what i observed using up 5 30ml Bottles....

You could use the search function here on this board or on Love Scent board or on AD - forum or read Nbully's blog ...

Love Scent offers an 30% discount code this month and this would be the chance to try it out if you're only curious !

If you think you're going to use it on a regular base i recommend to order directly at Vero Labs ...

(02-12-2011 11:30 AM)evensteven69 Wrote: [&nbsp;](#)I have read up on Oxytocin, and am curious about it and it's effects.

"Excessive dosage of Oxytocin or long term administration (over a period of 24 hours or longer) have been known to result in tetanic uterine contractions, uterine rupture, postpartum hemorrhage, and water intoxication, sometimes fatal."

"Oxytocin has a half-life of typically about three minutes in the blood. Oxytocin given intravenously does not enter the brain in significant quantities - it is excluded from the brain by the blood-brain barrier. There is no evidence for significant central nervous system entry of oxytocin by nasal spray. Oxytocin nasal sprays have been used to stimulate breastfeeding but the efficacy of this approach is doubtful."

Taken out of context from wikipedia.

*Pheroman - February 13, 2011, 3:11 am*

For me Liquid Trust has been one of the most consistent products I have use over hundreds of encounters and situations.

For general work use I actually prefer it to wolf.

It's never failed to get a positive reaction in the least.

Note this is in work and social (but not flirtatious) only situations.

I dont use it all the time, but when I do it seems to work.

*kmacc45 - February 13, 2011, 7:07 am*

Read up on this molecule on Paradise 7 site. Daine said the molecule is to heavy and have no purpose outside the body. Interesting read check it out and see what you think.

*mark-in-dallas - February 13, 2011, 7:55 am*

Yeah, she spewed the exact same thing that you can find on a number of sites. Gotta remember, she also says Androstenone is a pig pheromone and refuses to use it in any of her mixes.

*Pheroman - February 13, 2011, 3:19 pm*

So does James Kohl, and doing some research I see it mention in pig breeding discussions, and it's in that sections of many customs substance catalogs.

So I'd have to agree it is a pig pheromone

But one that seems to have effect on some humans, sometimes positive sometimes negative.

Does this mean men have to smell like a pig to attract a slut? (it's joke btw)

Or does it mean "All men are pigs", and thats just how many women want them...

*mark-in-dallas - February 13, 2011, 4:31 pm*

Androstenone is a pig pheromone and wehn a female pig smells it she will immediately assume a mounting position. To bad it doesn't work that way with human females too huh?

But, Androstenols do break down into Androstenone on human skin. So, pig pheromone or not it, is found in humans and if it didn't serve some purpose it would likely haved morphed into another chemical that did serve a purpose, through evolution.

Just because its a pig pheromone doesn't mean its not a human pheromone as well. We have very similar organs, and infact have already transplanted pig livers into humans, although it hasn't yet proven very successful due to immune system rejection. The again, our immune system rejects organs transplanted from other humans too.

I think i have read a report about this, and if i remember right it said Androstenol would start break down to none after about 20-30 minutes. Wonder if it have the same effect when Androstenol are used in cologne? And applying a cologne who have both none and nol with correct dose at start

would turn in to an overdose of none after a while?

Where as the Oxytocin is a chemical that is released in the body when organisming. So am wondering if I will get social experience plus more. Any advice? I used up 30 ml of the original Liquid Trust its the one without the added pheromones and i can say it was excellent when i used it to gain trust in interveiw situations, i would apply it as close as possible to the time of interaction with my targets and use at least 4 good sprays across my shirt front at chest level, and my targets would remain under its influence for around an hour and then it dissapates.

I did not ever really notice any female attraction benefits from my applications of Liquid Trust so i then kept it for interveiw situations where it worked well even when being interveiwed by females.

This juice is not cheap, but it could be very worthwhile to those wishing to close an important deal and in this case it would easily justify its costs.

(02-13-2011 2:55 AM)mark-in-dallas Wrote: [&nbsp;](#) Yeah, she spewed the exact same thing that you can find on a number of sites. Gotta remember, she also says Androstenone is a pig pheromone and refuses to use it in any of her mixes.

I read that in the paper from "Perfumery and the Sixth Sense" paper by Chloe Jennings-White from EROX/naturalattraction.com. It really labeled androstenone and androstenol as pig pheromones. It seems that they really dismiss the effectiveness of pheromones that they do not have patents on. I think they have a patent on using Androstadienone in perfume/cologne, not on Androstadienone , just it's use in cologne.

It seemed to me that she seems to dismiss pheromones that are not exocrine/apocrine/skin/secretions in the paper. As well as calling androstenone and androstenol "pig" pheromones.

Androstenone is a "HUMAN" pheromone. It is not excreted by the endocrine apocrine glands on the skin, it is excreted by the axilliary glands on human skin. It is also excreted from the human body by the endocrine system, (kidneys) in pee (urine).

Araneda & Firestein, The Physiological Society 2003

<http://jp.physoc.org/content/554/1/1.full.pdf>

Rogawski, JPET May 2006 vol. 317 no. 2 694-703

<http://jpet.aspetjournals.org/content/317/2/694.full>

While pee is not sweat, look to the monkeys, and their courting/mating ritual of washing their feet in pee. Seems like many animals communicate and mark their territory with pee. Seems like androstenone is a "HUMAN" pheromone and it's labeling is not incorrect when calling it a "PIG" pheromone, because pigs use it. It is not in their sweat, it is in their saliva. Seems that pheromones, such as "PIG" androstenone, are not limited to skin/apocrine glands, if androstenone come out of the mouth/saliva.

I think it shows a bias, in the case of Chloe Jennings-White, to her investments and business endeavors of the Androstadienone patents, to diminish the reputation of Androstanone while

promoting Androstadienone . I think in some ways this type of information has been spread around so much that it is taken as hearsay truth.

We don't need to call Androstenone/None a pig pheromone, same with Alpha Androstenol and Beta Androstenol (Androstenol). They are excreted by Humans.

In addition, I feel, (notice this is an "I feel" statement) that pheromones are not limited to VMO in humans Olfactory sensors can be used for both chemiosensory as well as pheromone sensing. Limiting it to the VMO response to define a pheromone is a bias that only goes to push a business agenda, try to persuade a customer to a product that you have a patent on.

If oxytocin is in pee too, then gee, pee willikers, it could be a pheromonal chemiosensory molecule.

Urinary oxytocin as a non-invasive biomarker for neurohypophyseal hormone secretion, by Polito et al

Peptides Volume 27, Issue 11, November 2006, Pages 2877-2884

<http://www.sciencedirect.com/science/article/pii/S0196978106002439>

If oxytocin is too heavy to diffuse, does that mean it isn't a communication chemical? NOOOOO! Look at how close dogs get to sniff each other. Pretty darn close. They may need to be that close to get the heavier molecules information, they can use their excellent noses for the lighter molecules at a distance.

So oxytocin in close proximity vs. oxytocin at a meter might be a better debate than "oxytocin all or nothing" with regard to pheromone status.

Seems this turned into a rant. sorry everyone, sorry erox too, just posting my opinions.

*Fishdude - August 30, 2011, 1:38 am*

before I really got into Pheromones I went thru 6 bottles of liquid trust. But nothing compared to what you get these days (10 years ago) save your money. I smelled nice and got compliments. Course, last week I sprayed a bunch of febreze on my nice wool pants and let them air cool dry before work. The cab driver said "that is the most wonderful cologne you are wearing." I rest my case!

*Fishdude - August 30, 2011, 1:44 am*

oxytocin is a chemical that is released by your brain when you have sex or other romantic moves. It builds trust. I know Pago et al swear by it but I am still dubious. Purchasing liquid trust and using it as a standalone will tell you. I showerd in it 10 mins before meetings at work or with women, yes you smell nice but that's it. Build trust with an A314 and add nols and you will notice the difference.

Or like I said, some febreze will get you noticed more.

was liquid trust around 10 years ago?

Does the infant mother oxytocin bond come from smell or digesting it with milk?

I have a big bottle and it doesn't have a scent, it is just oxytocin and ethanol. sure the alcohol smells like alcohol for the first minute, but no scent that i notice after that. Especially no added fragrance. Does oxytocin have a oder that I'm Asnosmic to?

Pheroman - August 31, 2011, 10:08 am

Well Liquid Trust does have a smell to me after the alcohol dissipates.

It's fairly strong at first but quickly dies out just as fast as Liquid Trust becomes ineffective.

I dont think it smells nice though.

I used it standalone in many business/work situations and it always added to the interaction.

1 or 2 sprays on chest just below chin is all i ever used.

(08-29-2011 8:38 PM)Fishdude Wrote: [&nbsp;](#)I smelled nice and got compliments. Well I never got compliments, but it obviously had effect otherwise you would not have gotten them.
